

books-62 — Schedule B, the form you actually file

For: Michael Lyman, Greenway Marijuana **Date:** 26 August 2026

What you can now do

Open **Admin** → **Books** → **Form 941** → **Sheet** and you get three pages of real paper instead of two: Form 941 page 1, page 2, and now **Schedule B**, filled from your own payroll, one figure per payday, in the numbered space for the day the wages were paid.

You told me: *"I am a schedule b filer, so we don't need to compute the monthly payment, we need to compute the bi weekly payment figure and add it to that form next."* That is what this slice did, with one correction worth knowing: Schedule B is a **daily** form, not a fortnightly one. It has 31 numbered spaces per month and the liability lands on the space for the payday. Your fortnightly cycle means seven or eight of those 93 spaces carry a figure and the rest stay empty. So the figure is computed per payday exactly as you asked; the form just files it by date.

The bottom line ties. Schedule B's quarter total **must** equal line 12 of the 941, and the code refuses to draw a schedule that does not. On your filed Q2 2026 it comes out at **14,204.57** against line 12 of **14,204.57** — the month blocks being 4,058.46 + 6,087.67 + 4,058.44.

Line 16 on page 2 also works properly now. All three of its ticks are clickable, and the lesson says plainly that the **semiweekly** tick is yours, that the three monthly boxes beside it stay **blank**, and that a blank monthly grid on your return is correct rather than an omission.

What I found

Three real defects, all now in `docs/DEFECTS.md` with the gate that catches each. The important one:

#	What it was	Why it mattered
D-04	"Cents boxes hold 3 characters" was true of the 941 and assumed everywhere	Schedule B uses 2. All 97 of its cents boxes would have printed empty. Caught before it shipped, by measuring instead of reusing the constant.
D-06	Only 1 of line 16's 3 ticks could be clicked	The semiweekly tick — the one that declares Schedule B is attached, the one you use — was the unreachable one.
D-07	Every deliberately-empty money box printed <code>0 00</code>	86 of the 93 day cells. On a daily liability form that is a positive statement that wages were paid on 86 days. Found by looking at the rendered page once, after all the arithmetic tests were already green.

D-07 is the one I want you to see the shape of, because it is the kind of thing only a picture catches. The figures were right. The totals tied. Every test passed. And the page said Greenway paid wages on 86 days it did not, on a schedule signed under penalties of perjury. The fix is one line at one call site, and it now covers every form that splits dollars from cents — so the W-2 and the 941 are protected by the same change.

What is deliberately not done

The **quarter tick** at the top of Schedule B is left for you. Ticking a box on a document filed under penalties of perjury is a declaration, and declarations are yours to make, not software's. The lesson on that box says so and tells you to match it to the quarter ticked on the 941.

I did **not** add Schedule B to the numbered-line form explorer. That surface is organised by line number and Schedule B has a 93-cell calendar instead of numbered lines; it would have rendered as 93 rows saying "day 4". The full clickable form is on the sheet page, which is where you asked for it.

On your instruction — *"if we need to skip some lessons for now so we can finish building that is fine"* — I stopped at 100 lessons for Schedule B's 100 boxes and wrote no further teaching material this slice. The day-cell lessons are generated from one sentence with the day substituted rather than hand-written 100 times.

Where the budget went, and the four open questions

Every gate that had to be green is green: 469 test files, 11,480 tests, type check clean, lint clean, 345 quotes verified against local sources. I added **5 tests**, not fifty, and I merged them into the existing Schedule B file rather than starting a new one.

The saving that actually worked this slice was the defect register. D-07's story is told **once**, in `DEFECTS.md`, and cited by number from the code and the test. Under the old habit that story would have appeared at length in four places.

1. **Form 940 and the W-3 next, batched as one slice?** They share the mechanism Schedule B just paid for, so together they should cost far less than this one did. That was your build order and I intend to follow it unless you say otherwise.
2. **Do you want ESD 5208A/B and PFML/WA Cares after that,** or would you rather I stop the forms there and go back to connecting the ATM feed, intercompany rent and bank feeds? You said forms first, then wiring — I want to confirm before spending on four more forms.
3. **Is 100 lessons per form still worth it?** I can render a form perfectly with a fraction of the teaching text. Say the word and later forms get boxes that work and lessons only on the boxes that bite.
4. **Should the sheet print?** Right now it renders on screen. If you want to hand a CPA a PDF of the filled 941 plus Schedule B, that is a small, self-contained job I have not started.
